Abstract
We consider the class $S_p$ of those functions

$$f(z) = z + a_{p+1}z^{p+1} + \ldots$$

univalent in the unit disk $\Delta$. We show that if $f \in S_p$, where $p$ is large, then

$$\alpha(f) = \lim_{n \to \infty} \frac{|a_n|}{n} \leq \alpha(p) = \frac{2(\log p \log \log p)^2}{p^4}.$$ 

We also obtain upper bounds for $|a_n|$ when $f \in S_p$. 

In the opposite direction, examples are constructed of functions $f \in S_p$ for which $\alpha(f) \geq C_0 p^{-4}$, where $C_0$ is a positive absolute constant.
